1. A mobile telephonic apparatus for a user, said apparatus comprising:

a housing;

a speaker positioned with said housing, wherein said speaker is adapted to provide input and output signals;

an antenna rotatably attached to said housing and is adapted to receive radio waves;

a microphone adapted to transmit audio signals and is supported by said antenna such that said microphone is able to be slid along said antenna by the user until the position of said microphone is in a comfortable position for the user.

2. A mobile telephonic apparatus for a user, said apparatus comprising:

a housing;

a speaker positioned with said housing, wherein said speaker is adapted to provide input and output signals;

a microphone also positioned with said housing and is adapted to transmit audio signals;

an acoustic pipe having a mouth end, a microphone end, and an inside wall wherein the mouth of said acoustic pipe is presented close to the mouth of the user and wherein the microphone end of said acoustic pipe is immediately adjacent to said microphone such that sound waves from the user's voice are transmitted along said acoustic pipe to said microphone;

an antenna adapted to receive radio waves and comprises a single core wire positioned along the inside wall of said acoustic pipe.

- 3. A mobile telephonic apparatus for a user, said apparatus comprising:
 - a housing;
- a speaker positioned with said housing, wherein said speaker is adapted to provide input and output signals;
- an electrically nonconductive variable length sheath rotatably attached to said housing;

an antenna embedded with said sheath and is adapted to receive radio waves;

a microphone adapted to transmit audio signals and is supported by said

sheath such that said microphone is able to be slid along said sheath by the user

until the position of said microphone is in a comfortable position for the user.
